

## CHANNELS

Concrete channels are a vital component to overall flood control plans. Urban areas can be quickly inundated with stormwater and a reliable method is required to quickly vacate the excess runoff. Architects often turn to concrete channels for their capacity to move large volumes of water rapidly.

Fast Tilt is a quick, economical solution for the construction of these channels, providing a reliable solution for controlling and draining water while protecting the environment and the surrounding structures.

**Fast Tilt Retaining Wall is an award-winning tilt-up retaining wall system that provides dramatically faster construction time, cost savings and complete artistic and aesthetic freedom.**
